

MDNR Appendix F - General Comment 121:**Comment:**

A conceptual site exposure model (CSEM) has not been provided for review. Please revise the document to include a CSEM for all potential receptors, on and off site.

Discussion:

Each long-term risk section contains a description of the conceptual site model in the text. A conceptual model of the short-term risks evaluated for each alternative will be added to appropriate short-term risk assessment sections. An enhanced description of receptor selection will be added to long-term and short-term human health risk assessments.

Proposed Text Change:

The proposed changes to the risk assessment text and tables have been incorporated into the current draft of Appendix F. Additional revisions to data and results are being made as updated information about schedules and processes become available.

EPA FEEDBACK:

EPA generally accepts this response; however, EPA will have to review the revised Appendix F in the final SFS report to ensure that the revisions adequately address this issue.
